Release Date: February 2018

Snap Ring for SRG Convection Fan Motor

A 1/2" snap ring is used at the end of the convection fan motor shaft to prevent the blower wheel from dropping off of the shaft in the event the blower wheel's set screws become loose. The snap ring is located on the shaft by a groove in the circumference of the shaft. The snap ring will now ship with the convection fan motor when a replacement motor is purchased. The snap ring will be taped to the housing of the motor and should be installed with a pair of snap ring pliers.
